## How to Choose an Affordable Spout Pouch Filling Machine

Last updated on December 2, 2024

### 1. Output Matching: Reject "Overcapacity" or "Undercapacity"

#### Calculate the Equipment Speed Based on the Daily output

If 50,000 bags need to be produced per day, calculated by 8 hours of effective production per day, the actual stable speed of the equipment must be  $\geq 104$  bags/minute (reserve 20% redundancy to cope with losses such as model change and cleaning).

#### Practical Solution

Choose models with modular designs (3-12 heads), with speeds ranging from 30 to 200 bags/minute, which can be flexibly configured according to output to avoid overcapacity or insufficient capacity.

### 2. Material Adaptation: Let the Equipment "Understand" the Characteristics of Your Materials

Low-Viscosity Liquids (such as beverages, makeup remover)
